Reduce Windows Licensing Costs with AWS

Many organizations stick with inefficient and costly Windows environments because they don't know where to look for help. Business leaders don't always have the tools to determine their actual resource utilization requirements or the expertise to migrate workloads to the cloud successfully.

Fortunately, through the free Optimization & Licensing Assessment (OLA) program from Amazon Web Services (AWS), Microsoft users can easily identify areas of opportunity to right-size compute resources, cut unnecessary spending, and explore flexible licensing options.

Then, with ClearScale's help, companies can carefully assess different paths forward, build migration proof-of-concepts (POC), or pursue other modernization strategies to make the most of their OLA findings. With combined resources from AWS and ClearScale, we'll determine the best cost savings options for you in regards to your Windows workloads, and right size your servers on the optimal instances on AWS.

Benefits

Right-size Compute Resources

Through the OLA program, collect and analyze consumption data for all of your Windows workloads. Use the program's evaluation tools to learn what you need from a resource standpoint and how you should design your Microsoft environment to be optimized on AWS and mapped to the right instance types.

Reduce IT Spending

Discover where you overspend on third-party licensing and overprovisioned resources. Compare different OLA recommendations on how to extract the most value from existing licenses and avoid vendor lock-in without affecting application performance.

Explore Migration Scenarios

Lean on ClearScale's cloud experts to illuminate your OLA results and guide you in building a POC for one, or many, applications to prove the ease of migration to AWS. We can also help you architect an AWS Landing Zone for long-term scale.
